

Street Lighting Guidelines

The Developer shall provide street lighting designs to CORED Engineering Department for approval as part of the preliminary plat. All designs must be approved by the Engineering Department if they are to be provided for City of Oak Ridge public roadways.

In underground areas, lights shall be spaced at 250 ft. intervals, the end of cul-de-sacs, and at intersections of public roads. In overhead areas, lights are placed on every other pole.

CORED approved secondary pedestals shall be utilized at all light poles.

Two runs of 2 - 1/2 inch schedule 40 PVC conduit shall be utilized between light poles.

Pedestals and conduit shall be installed per CORED Standards.

Some form of lighting is required on all public roads. If gas lighting is planned for a development, then this must be stated on the preliminary and final plats. The style of lighting will be covered in the Developer's Agreement.
